# Possibilities for 100% renewables in Australia's electricity sector

***Iain MacGill***

Associate Professor, School of Electrical  
Engineering and Telecommunications  
Joint Director (Engineering), CEEM

*How and when can Australia  
go 100% renewable?*

AIE Sydney Branch Meeting  
12 May 2014

# Growing interest in future high RE electricity sector

- Many drivers including
  - climate change and other environmental impacts
  - energy security (most countries see fossil fuel \$ as economic liabilities)
  - falling costs for some key renewable technologies, deployment success
  - poor progress with some of the ‘alternatives’
- Some key questions
  - *Technical feasibility?* – can high (even 100%) renewables mixes utilizing highly variable and somewhat unpredictable solar and wind reliably meet demand at all times and locations
  - **If yes**, is it an *ethical* course of action and will it facilitate broader sustainability objectives
  - **If yes**, *Economic feasibility?* – is 100% renewables economically worth doing given likely costs vs costs of inaction, other options
  - **If yes, how might we get there and what is required now**

# Significant regions of world currently have local energy deficits

Figure TS-5 | Number of people in countries that are dependent on imported

# Some (but not all) key RE technology costs falling

*... or not rising as fast  
as costs of some  
other options*

# Non-climate enviro impacts also becoming key drivers

“China’s State Council has announced that it is banning the construction of new coal-fired power plants near Beijing, Shanghai and Guangdong. The goal is to cut air pollution in the country’s eastern megalopolises. The hope is that by 2017 Beijing residents will be breathing in 25% less fine particulate matter than in 2012.”

## Planned coal capacity retirements 2013-2022

### Capacity (MW)

### NERC region

# An elephant in the room – Climate Change

- Currently a lack of domestic and international progress, apparent loss of public and political interest and will in some jurisdictions
- ... but even a dead elephant in the room is a problem

# Climate protection requires major global... and hence Australian emissions reductions

**FIGURE 9.3: RECOMMENDED GOALS FOR AUSTRALIA**

**Note:** Assumes both the Authority's 2020 target recommendations are accepted—a 15 per cent target plus an additional 4 percentage points from carryover—giving an effective target of 19 per cent.

**Source:** Climate Change Authority

# With major job ahead for electricity sector

Direct Sectoral CO<sub>2</sub> and Non-CO<sub>2</sub> GHG Emissions in Baseline and Mitigation Scenarios with and without CCS (IPCC, 2014)

# RE one of the few emission reduction successes to date

... although progress may be faltering and still a long way to go

*Other key success is falling demand in some OECD countries*

## 1.3 Annual capacity investment

(IEA, 2013)

FIGURE 5. GLOBAL NEW INVESTMENT IN RENEWABLE ENERGY BY SECTOR, 2013, AND GROWTH ON 2012, \$BN

FIGURE 23. RENEWABLE POWER GENERATION AND CAPACITY AS A SHARE OF GLOBAL POWER, 2007-2013, %

Renewables figure excludes large hydro. Renewable capacity figures based on Bloomberg New Energy Finance global totals.

(BNEF, 2014)

# Taking a longer-term perspective, 100% renewables a question of when.. and how

- *Our only technically feasible truly long-term option*
- *... although seemingly plenty of fossil fuels, other options*

	Historical production through 2005	Production 2005	Reserves	Resources
	[EJ]	[EJ]	[EJ]	[EJ]
Conventional oil	6069	147.9	4900–7610	4170–6150
Unconventional oil	513	20.2	3750–5600	11,280–14,800
Conventional gas	3087	89.8	5000–7100	7200–8900
Unconventional gas	113	9.6	20,100–67,100	40,200–121,900
Coal	6712	123.8	17,300–21,000	291,000–435,000
Conventional uranium <sup>b</sup>	1218	24.7	2400	7400
Unconventional uranium	34	n.a.		7100

(Murphy, <http://physics.ucsd.edu/do-the-math/>, 2012)

# Growing plans on transition pathways

DANISH MINISTRY OF  
CLIMATE, ENERGY AND BUILDING

## **DK Energy Agreement, March 22 2012**

- With the Energy Agreement of March 22, we have succeeded in obtaining broad political commitment to an ambitious green transition for Denmark that focuses on energy savings throughout society and promotes renewable energy in all sectors.
- This agreement implies a 12% reduction of gross energy consumption in 2020 in comparison to 2006; a share of 35% renewable energy in 2020; and 50% wind energy in Danish electricity consumption in 2020.
- The agreement is important for delivering on the political goal that Denmark's entire energy supply (electricity, heating, industry and transport) is covered by renewable energy in 2050.

# Some alternatives struggling at present

## CARBON CAPTURE AND STORAGE

CCS is another area of technology that could help to curb emissions, if applied to coal- or gas-fired power stations or to carbon-intensive industrial plants such as cement works. Progress with carbon capture has, however, been disappointing in recent years. Five projects at demonstration scale (1MtCO<sub>2</sub>/yr) have started construction or operations but this is still short of 2005 G8 targets of 20 operational projects by 2020.

In 2013, investment fell to just \$1.8 billion, down 59% from 2012's \$4.3 billion. Last year's total was split between government and corporate R&D spending, steady at \$1.6 billion, and asset finance, at just \$128 million compared to \$2.7 billion the previous year.

*(BNEF, 2014)*

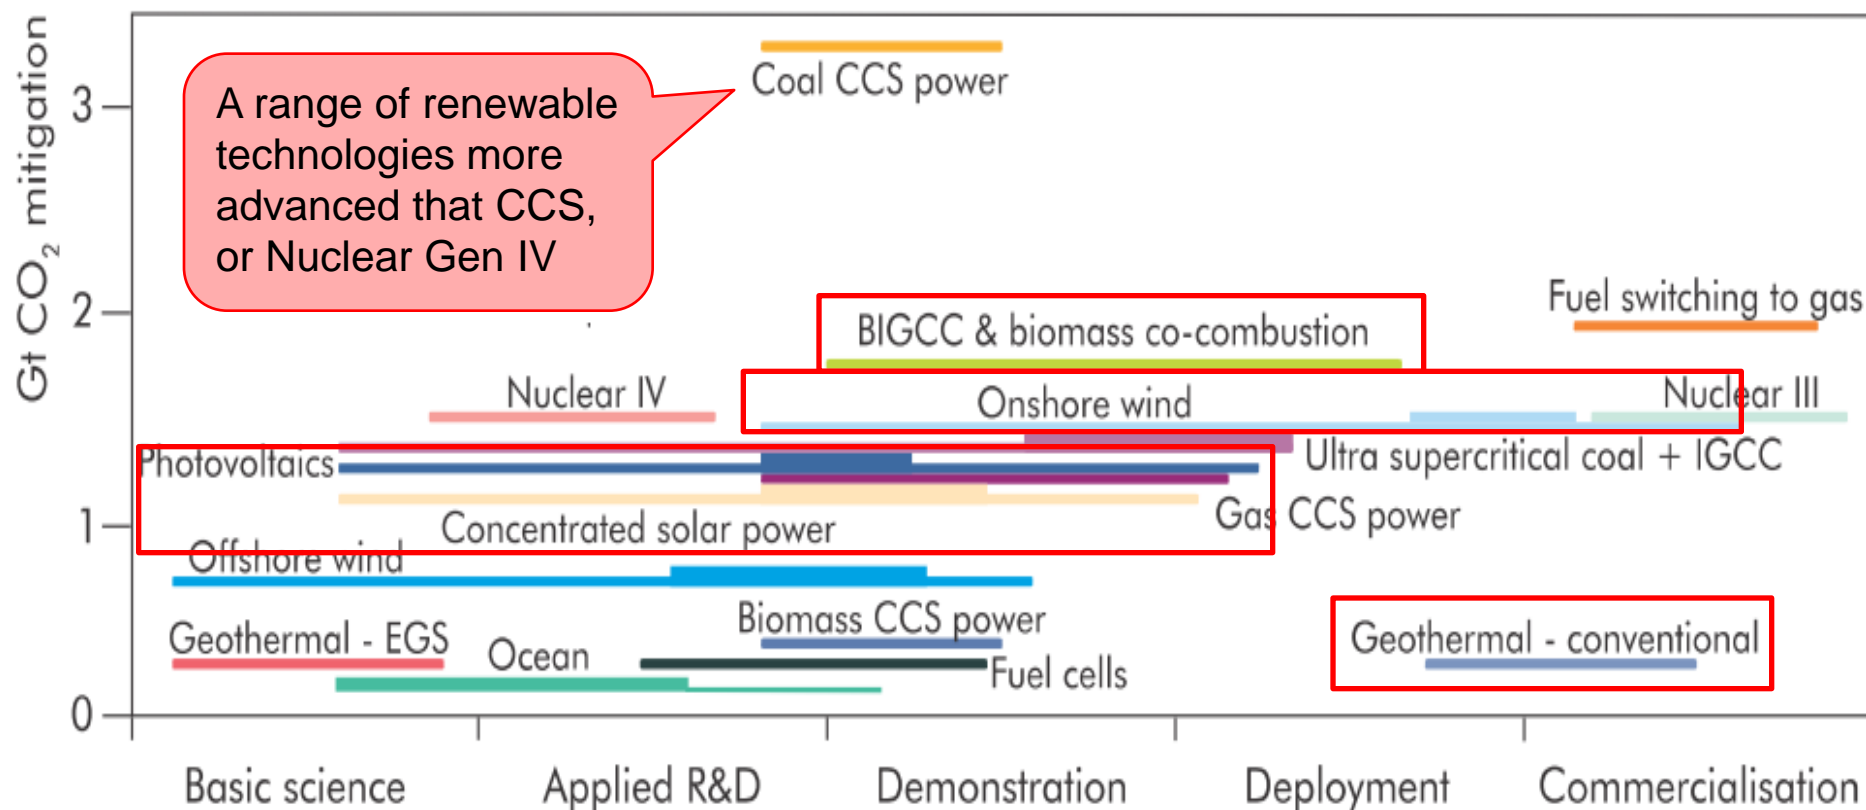

## 1.11 Annual capacity investment<sup>3</sup>

# Technical feasibility: range of proven renewables

**Figure 4.6** ► Near-term technology development priorities and CO<sub>2</sub> mitigation for power generation technologies (IEA, *Energy Technology Perspectives*, 2010)

Technical feasibility: 'what exists is possible'  
wind a significant contributor in growing number of electricity industries around the world

Electricity consumption from renewable sources

# High renewables for the NEM?

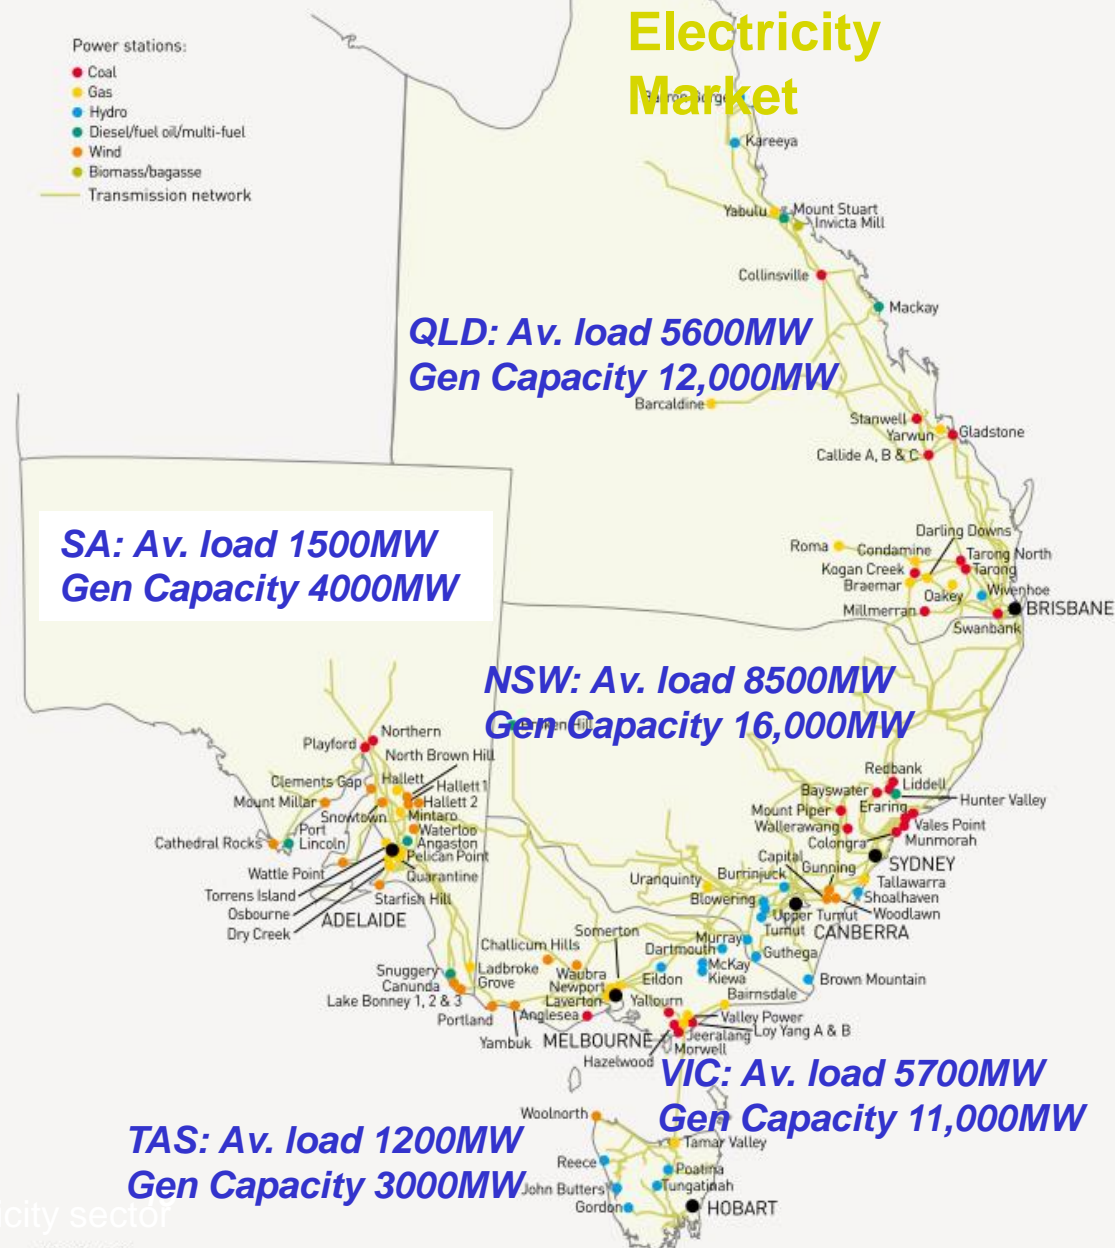

A significant change from current mix with some hydro, modest wind  
*Note missing PV, other non-registered renewables*

**Figure 1.4**  
Registered capacity in regions, by fuel source, 2011

**Figure 1.2**  
Large electricity generators in the  
National Electricity Market

(AEMO, [www.aemo.com.au](http://www.aemo.com.au), 2011)

# The Australian National Electricity Market

# Technical feasibility?: Simulations based on hourly estimates of RE availability across the NEM versus demand – *eg. a challenging Week in Winter 2010*

Supply/demand for the National Electricity Market (2010)

(Elliston, 2012)

# Economic feasibility - 100% RE findings

(Elliston, 2013)

A\$b/yr for AETA *high* and *low*  
technology cost scenarios

Without transmission		With transmission	
Low cost	High cost	Low cost	High cost
19.6	22.1	21.2	24.4

## Generation mix

By capacity

By energy

Low tech.  
cost

+ 8.8 TWh  
spilled

High tech.  
cost

+ 24.9 TWh  
spilled

Current NEM costs  
approx. \$10b/year. At  
carbon prices of \$50-  
100/tCO<sub>2</sub> 100%  
renewables costs can  
be lower cost than  
'replacement' scenario

# Additional scenarios for comparison

- CCGT: conventional CCGTs plant, existing NEM, OCGT
- CCGT + CCS: as above with CCS on CCGTs
- Coal + CCS: supercritical pulverised black coal with post-combustion CCS, existing hydro, OCGT

(Elliston, Renewable Energy, 2013)

CCGT (\$9/GJ)	+	CCGT-CCS (\$12/GJ)	□
CCGT (\$12/GJ)	x	coal-CCS (\$9/GJ)	▽
CCGT-CCS (\$9/GJ)	*		

# AEMO 100% RE – least cost capacity mix

**Scenario 1:** Rapid transformation and moderate growth—this scenario assumes strong progress on lowering technology costs, improving demand side participation (DSP), and a conservative average demand growth outlook in the lead up to the year being modelled.

**Scenario 2:** Moderate transformation and high growth—this scenario assumes current trends in lowering technology costs, moderate DSP, and robust economic growth in the lead up to the year being modelled.

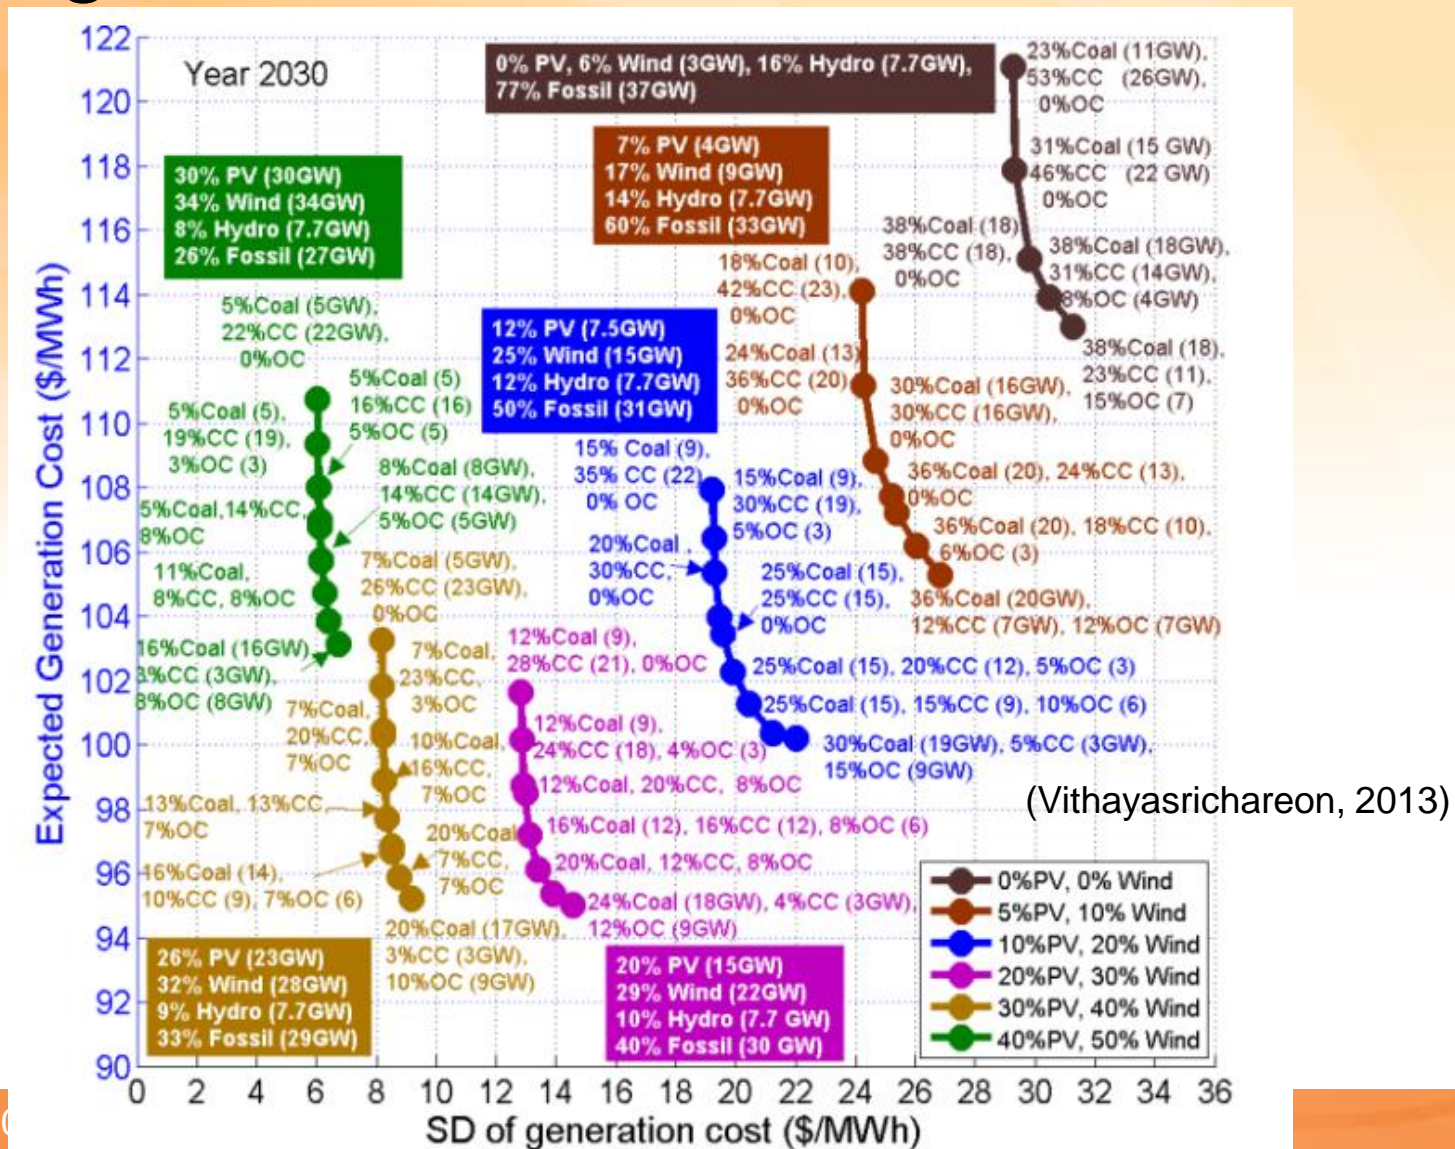

# Comparing 100% RE versus other options

# Does high RE add or reduce risk?

# How to get there? Better understand how markets are responding to renewables already present

Energy source	South Australia registered generation capacity		Electricity generated in 2012–13 by energy source	
	Megawatts (MW)	Percentage of total	Gigawatt hours (GWh)	Percentage of total
Gas	2,672	50%	6,786	52%
Wind	1,203	23%	3,483	27%
Coal	770	14%	2,238	17%
Rooftop PV <sup>a</sup>	400	7%	497	4%
Diesel	270	5%	12	<1%
Landfill methane/ landfill gas	16	<1%	55	<1%
Hydro	3	<1%	6	<1%
<b>Total</b>	<b>5,334</b>	<b>100%</b>	<b>13,077</b>	<b>100%</b>

Cash flows due to addition of PV under NM

G: Generators  
Gov: NSW government  
All eC: All electricity customers

(Oliva, 2014)

# Smart grids and Demand-Side Participation can improve our options for high RE

## 4.5 Smart grid technologies

(IEA, 2012)

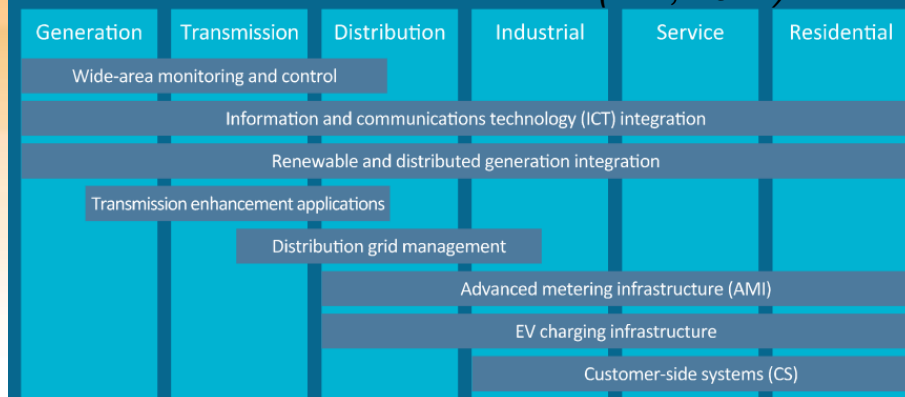

Table 15.1 Emissions reductions and investment needs in the 2DS, by technology

Sector (IEA, 2012)	CO <sub>2</sub> savings (Gt) 2050	Cumulative CO <sub>2</sub> savings (Gt) 2010 to 2050	Investment needs (USD trillion) 2010 to 2050
Power generation			
Bioenergy for heat and power	1.7	20.4	0.5
CCS in power generation	3.3	57.0	2.6
Concentrating solar power	1.7	22.5	2.6
Geothermal for heat and power	0.5	7.1	1.3
High efficiency, low emissions coal	n.a.	n.a.	1.9
Hydropower	0.9	19.4	3.0
Nuclear	3.2	59.6	4.0
Smart grids	1.7	36.4	5.0 to 6.0
Solar photovoltaic (PV)	1.7	27.7	3.9
Wind	3.0	61.0	5.9

## 4.2 Global cumulative smart meter installations

FIGURE 27. NEW INVESTMENT IN ENERGY-SMART TECHNOLOGIES, 2004-2013, \$BN

Asset finance includes smart grid and power storage only, excludes roll-out of efficiency and advanced transportation products

Source: Bloomberg New Energy Finance

# Potential policy implications

- Renewables will likely play the key role in any effective global and Australian electricity *supply* sector response to climate change
- ... and offer other potential benefits
- As such, require major, appropriately targeted and robust deployment oriented policy support
- ... as do other potential options
- continuing, and expanding now
- ... and as renewable penetrations grow we need governance arrangements to ensure appropriate energy market design, regulation and policy frameworks that can manage the challenges that will emerge
